Professional Summary

Junior Cloud Engineer who designs, automates, and operates cloud infrastructure end-to-end – from Terraform provisioning through containerized deployment to production monitoring. Hands-on with AWS, Docker, Kubernetes, and GitHub Actions, with a focus on Infrastructure as Code, CI/CD automation, observability, and secure network design. Comfortable troubleshooting live systems and writing Python/Bash automation to reduce manual operational work. Building working knowledge of Microsoft Azure alongside AWS and looking to contribute within an international engineering team.

Technical Skills

Cloud - AWS (EC2, S3, IAM, VPC, Route 53, Lambda, RDS, ECS, ECR, ELB, CloudFront); Microsoft Azure (currently learning)

Infrastructure as Code - Terraform (modular, provider-based, state-managed deployments)

Containers & Orchestration - Docker, Kubernetes (Minikube, k3s), Amazon ECS, Amazon ECR

CI/CD & Automation - GitHub Actions, AWS CodePipeline, CodeBuild, CodeDeploy

Monitoring & Observability - Prometheus, Grafana, Alertmanager, Amazon CloudWatch

Networking - VPC/Subnet design, Route Tables, Security Groups, NACLs, DNS, Load Balancers, Nginx

Security - IAM least-privilege policies, SSH key-only auth, UFW, Fail2Ban, secrets management over hardcoded credentials

Linux Administration - Ubuntu Server, Amazon Linux, systemd, cron, log analysis; RedHat fundamentals

Programming & Scripting - Python (automation), Bash/Shell, YAML, JSON

Version Control - Git, GitHub, branching workflows, VS Code

Cost Optimization - AWS Cost Explorer, resource right-sizing, tagging strategy

Technical Projects

Aravanta CloudOS – Cloud Infrastructure Automation Platform

In Progress • 2025–Present

AWS • Terraform • Docker • Kubernetes • Amazon ECR/ECS • AWS CodePipeline • Python • FastAPI

GitHub: github.com/yashbaviskar15/aravanta-cloudos

- Building a self-service platform for provisioning cloud resources and deploying containerized applications through Infrastructure as Code, targeting reduced manual setup time for new environments.
- Implemented backend services in FastAPI and PostgreSQL, containerized with Docker, with GitHub Actions automating build and deploy on every push.
- Adding monitoring, centralized logging, and role-based access control (RBAC) as core platform modules.
- Integrating Prometheus, Grafana, and centralized logging to provide real-time infrastructure monitoring, application observability, alerting, and troubleshooting.

AWS Three-Tier Web Application Infrastructure

Completed • 2024

AWS • Terraform • VPC • EC2 • Application Load Balancer • RDS • CloudWatch

GitHub: github.com/yashbaviskar15/3-tier-app

- Designed and deployed a highly available three-tier AWS architecture - public/private subnets, ALB, EC2, RDS - isolating presentation, application, and database layers for scalability and fault tolerance.
- Provisioned the full stack as version-controlled Terraform code: VPC, route tables, Internet Gateway, security groups, and compute - enabling repeatable, one-command redeployment.
- Load-balanced traffic across multiple EC2 instances and enforced strict network segmentation between application and database tiers via security groups and NACLs.
- Deployed RDS in private subnets under least-privilege IAM, with CloudWatch monitoring infrastructure health end-to-end.

CI/CD Pipeline with Docker, Kubernetes & AWS

Completed • 2025

GitHub Actions • Docker • Kubernetes • Amazon ECR/ECS • AWS CodePipeline

GitHub: github.com/yashbaviskar15/cicd-pipeline

- Built an automated build-test-deploy pipeline with GitHub Actions, cutting measured release time from 20 minutes to under 4 minutes in the project's test environment.
- Containerized a multi-service application, pushed versioned images to Amazon ECR, and deployed to Kubernetes using rolling updates for zero-downtime redeloys.
- Orchestrated the release workflow end-to-end via AWS CodePipeline, CodeBuild, and CodeDeploy, applying least-privilege IAM roles per stage in place of hardcoded credentials.

Cloud Infrastructure Monitoring with Prometheus & Grafana

Completed • 2024–2025

AWS EC2 • Terraform • Prometheus • Grafana • Docker • Linux

GitHub: github.com/yashbaviskar15/cloud-monitoring

- Provisioned monitoring infrastructure on AWS EC2 with Terraform as version-controlled Infrastructure as Code for repeatable, one-command setup.
- Deployed Prometheus across 10+ containerized services and built 5 Grafana dashboards for real-time CPU, memory, and application-level observability.
- Configured and load-tested Alertmanager thresholds, cutting measured mean time to detect (MTTD) from 15+ minutes to under 2 minutes.
- Triaged triggered alerts and analyzed logs to resolve performance issues; documented setup guides and runbooks for reproducing the stack across environments.

Education

Bachelor of Computer Applications (BCA) – CGPA 8.14/10.0

2023–2026

KCES's Institute of Management and Research, Jalgaon, India

Languages

English - Advanced (B2) • Hindi, Marathi - Native • German - A1 • French - A1
